

Role 5: E-commerce Analyst

Category: Finance

An E-commerce Analyst works at a company that sells products online and is responsible for tracking how those products are performing. Their job is to understand which products are selling well, which ones are getting strong customer reviews, how pricing and discounts are affecting sales, and where there are opportunities to improve. They do not manage the store directly -- they are the person who turns product data into clear insights that help the business make better decisions.

Company context:

ShopIQ is an online retail company that sells consumer electronics, home goods, and accessories through its own e-commerce platform. The company carries thousands of products across dozens of categories and competes on price, product quality, and customer satisfaction. Preet works as the E-commerce Analyst and is responsible for monitoring product performance week over week -- tracking ratings, review trends, discount patterns, and which categories are gaining or losing ground. Leadership relies on Preet to surface what is working, what is not, and where to focus attention next.

Key responsibilities:

- Tracking product ratings and review counts to identify which products customers are most and least satisfied with
- Analyzing pricing and discount patterns to understand how promotions affect perceived product value
- Identifying which product categories are performing well and which have low ratings or low engagement
- Summarizing customer review content to surface recurring complaints or praise across a category
- Preparing weekly product performance reports for the merchandising and marketing teams
- Flagging products that may need pricing adjustments, better descriptions, or review attention

Subject: *Looking for a faster way to understand our product data*

Hi,

I got your name from someone on our growth team who mentioned you help companies build tools to work smarter with their data. I wanted to reach out because I have been dealing with a problem I cannot seem to get ahead of.

I track product performance for our e-commerce platform. We carry thousands of products and my job is to understand what is working and what is not. Every week I need to answer questions like: which categories have the lowest customer ratings, which products are getting a lot of reviews but still scoring poorly, and whether our discount strategy is actually helping or just training customers to wait for a sale.

Right now I do this by exporting data, pasting it into spreadsheets, and sorting through it manually. I have product names, categories, actual prices, discounted prices, discount percentages, ratings, rating counts, and the full text of customer reviews. The data is all there. What I do not have is a fast way to actually use it.

When my manager asks 'what are customers complaining about most in the electronics category this month?' I have to read through hundreds of reviews to piece together an answer. When she asks 'are we discounting too heavily in home goods?' I have to build a pivot table from scratch.

I am not looking for anything complicated. Just something that helps me get from data to insight faster, so I can spend less time pulling numbers and more time actually advising the team.

Would love to connect if you have ideas.

Thanks,
Alex
